

Industrial Metal Cleaning Systems

Delicate and **Environmentally Friendly** **Metal Surface** Cleaning Technology

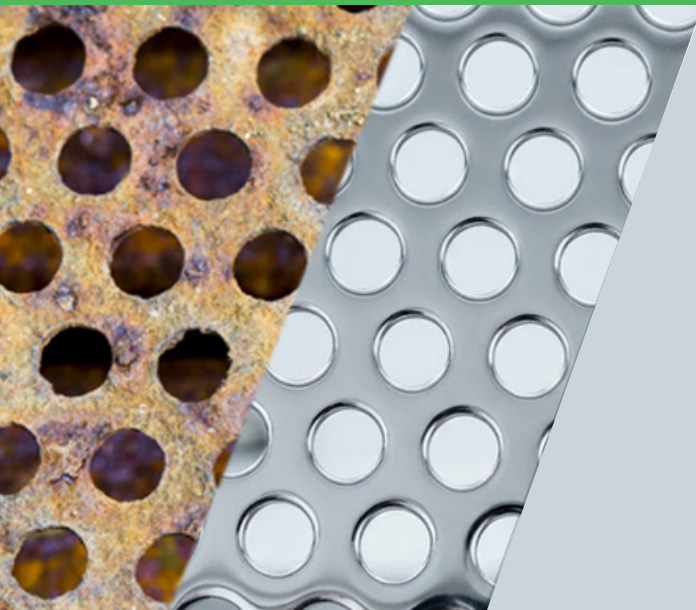

Our industrial metal surface cleaning service utilizes a special heated mineral pool, tailored to the specific properties of the metal being cleaned. Through gentle surface contact, we remove paint (electrostatic paint, wet paint, cataphoresis, etc.), plastic, rubber, and similar unwanted or faulty components from the metal surface without any abrasion or deformation. This process restores the metal parts for reprocessing, including paint shop conveyor racks, plugs, grilles, special apparatus, and grates, making them ready for reuse in a clean condition.

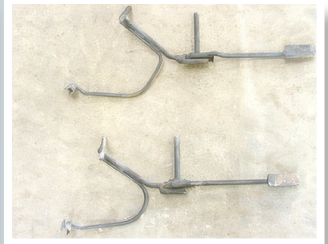

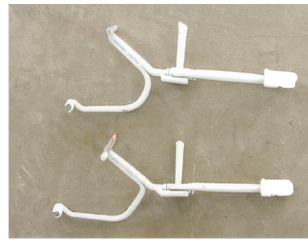

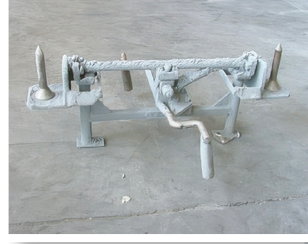

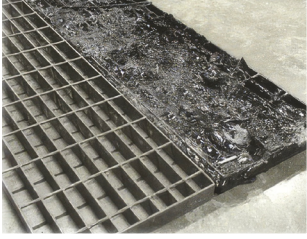

Our high-capacity system burns any toxic gases in a secondary combustion chamber at temperatures between 900-1200 degrees Celsius, resulting in clean and harmless gas emissions comparable to a natural gas chimney. Our system offers a significantly higher quality, faster, more cost-effective, and environmentally friendly solution compared to currently used methods such as incineration, sandblasting, and chemical cleaning.

Advantages of the System

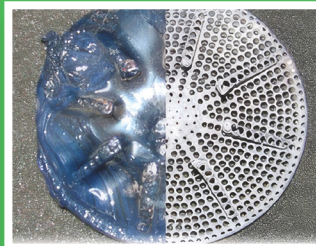

- It does not create a waste problem and consumes little natural resources.
- It releases emissions well below the minimum limit values.
- It produces rinsing water free of pollutants.
- It does not cause deformation in the physical structure of the metal, because the parts receive even and stable heat distribution within the machine.
- Within 60 minutes, all unwanted coatings on the metal material are removed without any wear or deformation on the surface.
